Module 1
What is Diabetes?

Time: 15 minutes
Diabetes is a condition in which the body either does not produce enough or there is a complete lack of insulin, a hormone produced by the pancreas.
Types of Childhood Diabetes

Type 1 Diabetes Mellitus (T1DM)
- No insulin produced by the pancreas
- Autoimmune, non-preventable
- NOT caused by eating too many sugary foods.
- It used to be known as ‘juvenile diabetes’ or ‘insulin-dependent Diabetes’.

Type 2 Diabetes Mellitus (T2DM)
- Not enough insulin
- Insulin resistance
- Can be genetic factors as well as lifestyle related

NOTE: The information in these modules relates to T1DM.
Function of Insulin

Normal blood glucose level (BGL) is 3.5 to 7.8 mmol/L.
What happens when there is no Insulin?

In T1DM the autoimmune process that attacks the beta cells results in no insulin being produced by the pancreas.

When there is no insulin being produced by the body, the BGL goes high. People with T1DM need insulin through injections or an insulin pump.

They need to test BGLs regularly by finger pricking or by a Continuous Glucose Monitor (CGM).
Signs and symptoms of diabetes

- Increased urine output
- Increased thirst
- Fatigue
- Weight loss
- Abdominal pain, nausea, vomiting
- Altered conscious state
Research 2018

‘The school experiences of children and adolescents with type 1 diabetes in Western Australia’

This research aimed to describe the mental health and the school experiences of children and adolescents with T1D attending mainstream schools in Western Australia. It was published in ‘Issues in Educational Research, 28 (3), 2018’.
